Melittin (MEL) is a major peptide constituent of bee venom that has been proposed as one of the upcoming possibilities for anticancer therapy.

### **Melittin: A lytic peptide with anticancer properties**

We recently established a GluA2 Q construct (GluA2 Q-STZ), where GluA2 Q is fused to the transmembrane AMPAR-regulatory protein (TARP)-?2 or stargazin (STZ), which positively modulates AMPAR activation, as a model for obtaining the structure of an activated, conducting state of a CP-AMPA via cryo-EM (Twomey et al., 2017a). In addition, this fusion construct design is an excellent recombinant ...

Probablemente, la forma más familiar de la señalización celular es la transmisión sináptica, en el que un impulso nervioso que ha llegado al final de una neurona se transporta a una neurona adyacente a través de la liberación de neurotransmisores. Esta transmisión se hace posible por la acción de las vesículas sinápticas cargadas con los neurotransmisores que se liberan.
